## ABSTRACT

Plant secondary metabolites (PSMs) such as flavonoids, terpenoids, alkaloids etc. have many biological, ecological and pharmaceutical significance. Owing to their immense importance, elucidation of their regulatory mechanisms is pivotal. Micro-RNAs (miRNAs), the small, endogenous, noncoding RNA molecules of about 21 nucleotides, capable of regulating gene expression in eukaryotes, are off late gaining attention as potent engineer in regulating plant secondary metabolite synthesis. They have been used in metabolic engineering as they can target mRNAs for cleavage and translational repression thereby regulating key biological processes. However, knowledge on their role in plant secondary metabolite biosynthesis is still in its infancy. The present review comprehensively encompasses the regulatory role of miRNAs in the biosynthetic pathways of major plant secondary metabolites such as alkaloids, terpenoids and flavonoids with notes on their target genes and their biosynthetic products, kinds of regulatory miRNAs with their respective regulatory roles and methods of detection with a note on the future direction of relevant research.

## 1. Introduction

Plants have been a prime source of food and medicine since time immemorial (Dey et al., 2020). Plants are considered as the storehouse of valuable metabolites owing to their immense benefit and use as food, medicine, nutraceuticals and pharmaceuticals (Modak et al., 2020). Plant metabolites are broadly characterized into primary and secondary types of which primary metabolites are mostly implicated to the growth and development of the plant. On the contrary, secondary metabolites, although not essential for the plant, are the defense molecules, primarily engaged in combating biotic and abiotic stresses in plants (Patra et al., 2013). An array of diverse plants secondary metabolites viz. alkaloids, flavonoids, tannins, phenolics, terpenoids, saponins, glycosides have been utilized by human for their immense pharmacological potential and health benefits (Debnath et al., 2018).

Off late, plant biotechnology, metabolic engineering and synthetic biology toolkits have been employed successfully to regulate and opti-

mize the production of valuable plant secondary metabolites for human use (Guerriero et al., 2018). Recently, miRNAs have been reported to play crucial roles in modulating many regulatory mechanisms in plants (Samad et al., 2017) including the production of secondary metabolites (Qiao et al., 2017). Additionally, they are flexible enough to be positively and negatively regulated, thus providing scope for increasing production of desired metabolites and limiting production of negative metabolites (Sabzevari and Naghavi, 2019). Until now, no review on the current topic was noted except one by Gupta et al., 2017, who compiled the reports on the identification and characterization of miRNA in the production of plant secondary metabolites. Since 2017, many works have been performed in the relevant fields and here we have tried to encompass the recent literature mostly keeping in mind the contribution of the older reports with notes on future perspectives.

miRNAs are small (21–23) nucleotide long, non-coding, single stranded ribo-regulators that has the ability to regulate the eukaryotic gene expression post transcriptionally by binding to mRNA (Treiber et
